

IN THE CLAIMS

Please amend the claims as follows:

Claim 1 (cancelled)

2. (previously amended) A dispenser as claimed in claim 21 wherein said pumping action comprises a pressure differential within said dispenser to drive said active substance through said flow restrictor.

3. (previously amended) A dispenser as claimed in claim 21 wherein said pumping action operates to displace a volume of air through said flow restrictor from the outlet side thereof, which volume of air, in turn, displaces said at least dose of active substance through said flow restrictor from the inlet side thereof.

4. (previously amended) A dispenser as claimed in claim 21 wherein said pumping action operates to reduce the surface tension of said active substance, in the region of said flow restrictor, for a time sufficient to allow a discrete dose thereof to be released through said flow restrictor.

Claim 5 (cancelled)

6. (previously amended) A dispenser as claimed in claim 21 further including at least one fluid dispensing surface spaced from the outlet side of said flow restrictor from which components of said active substance can emanate.

7. (original) A dispenser as claimed in claim 6 wherein said dispensing surface is positioned to receive active substance from said flow restrictor under gravity.

8. (previously amended) A dispenser as claimed in claim 6 wherein said dispensing surface is provided as one or more wall surfaces of a chamber positioned to receive active substance from said flow restrictor.

9. (original) A dispenser as claimed in claim 8 wherein said chamber is formed, at least in part, from a porous material.

B 10. (previously amended) A dispenser as claimed in claim 8 wherein said chamber includes a substantially vertical peripheral wall and closing means at the bottom of a said peripheral wall.

11. (previously amended) A dispenser as claimed in claim 10 wherein said peripheral wall is cylindrical.

AR 7/10/03 12. (currently amended) A dispenser as claimed in claim 21 wherein said chamber ^{restrictor} ~~an outlet side of said flow restriction~~ is defined by a non-porous peripheral wall section in combination with a porous bottom surface.

13. (previously amended) A dispenser as claimed in claim 21 further including venting means operable to maintain a void on the outlet side of said flow restrictor between flushes.

14. (previously amended) A dispenser as claimed in claim 8 further including ramp means constructed and arranged to direct water towards said chamber.

Claims 15-20 (cancelled)

21. (currently amended) A dispenser for suspension from the rim of a toilet bowl to dispense viscous liquid active substance into a stream of water created when the toilet is flushed, said dispenser including:

a reservoir for containing said viscous active substance;

a flow restrictor having an inlet side and an outlet side and including at least one aperture sized to, in combination with the viscosity of said active substance, restrain said active substance by surface tension from flowing under gravity from said reservoir; and

wherein said dispenser includes a path for said stream of water which path is in direct communication with said outlet side and wherein, in use, said stream of water serves to create a pumping action sufficient to overcome said surface tension.

flow directing means operable to lead said stream of water into direct contact with the outlet side of said flow restrictor whereupon, in use, said stream of water coming into contact with said outlet side serves to overcome said surface tension and allow a dose of said active substance to be released through said flow restrictor.
